08 Your genetics

DISCLAIMER

This report does not diagnose this or any other health conditions. Please talk to a healthcare professional if this condition runs in your family, you think you might have this condition, or you have any concerns about your results.

Personal information

NAME

Sample Client

SEX AT BIRTH

Male

HEIGHT

5ft 5" 165cm

WEIGHT

137lb 62kg

How this works

Our Wellness Reports analyze how your DNA influences your health.
We then use this analysis to give you personalized risk estimates and recommendations.

Similarly, our Trait Reports look at how your DNA influences your traits.

Your DNA is like an instruction manual — it contains a lot of information.
You can think of it as a blueprint for your body.

Genetic variants are parts of DNA that differ from person to person. Some can make you more vulnerable to certain health issues, while others may influence traits such as eye color.

We use artificial intelligence and machine learning to analyze all this information.
We then summarize your results as a risk score or display it on a gauge.

In total, we analyze up to 83 million genetic variants.

When we give a risk score, the risk icon tells you if you are at a higher or lower risk compared to other people:

Genotype color info:

AA

You don't have any risk alleles

AA

You have 1 risk allele

AA

You have 2 risk alleles

Your risk is also displayed as a percentile. This will tell you how your risks compare to our sample population. The lower your percentile number, the lower your risk. The "50th percentile" would be an average risk.

Similarly, the gauge tells you your relative risk score compared to our sample population, or it indicates a specific trait or haplotype you are more likely to have based on your genetic variants.

When applicable, we also list top evidence-based recommendations that may help lower your risk. The focus is on recommendations that may be of benefit to you, based on your genetics.

Our recommendations come in four categories: lifestyle, diet, supplements and drugs.
The following icons tell you which category a recommendation falls into:

Our team of scientists also ranks each recommendation.
We rank based on impact and the strength of evidence in the medical literature.

Impact shows how strongly a recommendation will affect your health in a certain area.
Evidence is how much scientific support there is for the recommendation. Rankings are from 1 to 5 (low to high):

Impact

Impact scores range from 1-5. These scores reflect how much of an effect each recommendation can have. An impact score of 5 predicts the biggest effect.

When a recommendation affects something we can measure, we use those measurements to assign the impact score. For example, a recommendation that decreases cholesterol by 20% will have a higher impact score than one that decreases it by 5%.

Some recommendations affect things that we cannot directly measure, like stress or mood. For these, the impact score is based on how well they work relative to other recommendations and standard treatments. The best ones get the highest scores.

If there is a lot of research that shows a recommendation works especially well for your genotype, the impact score gets increased.

Recommendation Evidence

5 / 5

Recommendations that are considered effective and generally recommended by experts and medical bodies.

4 / 5

Recommendations that are considered likely effective and that have multiple independent meta-analyses and a great many studies supporting them.

3 / 5

Recommendations that are considered possibly effective and have many studies supporting them

2 / 5

Recommendations that have insufficient evidence, with two or several clinical trials supporting them, or many studies but with ambiguous results.

1 / 5

Recommendations that have insufficient evidence, with a single clinical trial, or with many studies most of which didn't find support for the recommendation.

0 / 5

No evidence in humans.

Genotype-specific Evidence

High-quality

Direct evidence that a recommendation helps more in people with your gene variant (many clinical trials, a few large clinical trials, or a meta-analysis).

Medium-quality

Direct evidence that a recommendation helps more in people with your gene variant (a few clinical trials or one large clinical trial).

Low-quality

Direct evidence that a recommendation helps more in people with your gene variant (a single clinical trial or more trials with inconsistent results).

Indirect

A recommendation may help more in people with your gene variant because it targets a specific gene or protein affected by your variant (e.g., MTHFR, dopamine).

In theory

A recommendation may help more in people with your gene variant because it targets a specific mechanism affected by your variant (e.g., inflammation, oxidative stress).

Some things to keep in mind:

- Genetics doesn’t play a considerable role in a condition or a trait.
- There is not enough research available to estimate a genetic predisposition.
- There are technical limitations to estimating or presenting a genetic predisposition.
- The topic is sensitive, and a genetic predisposition should only be estimated and presented by a healthcare professional.

Introduction

UDP-glucuronosyltransferase (UGT) is an enzyme responsible for performing a chemical reaction called [glucuronidation](#), which is an important step in the body’s [detox process](#) [\[R\]](#).

Some important targets of UGT include:

- [Bilirubin](#), a waste product from the breakdown of [red blood cells](#) [\[R\]](#)
- [BPA plastics](#) [\[R\]](#)
- Steroid hormones [\[R\]](#)
- Medications: up to 15% of all FDA-approved drugs according to some estimates [\[R\]](#)

Importantly, UGT helps create [glutathione](#), one of your body’s strongest natural antioxidant defenses against the harmful effects of oxidative stress. Glutathione binds directly to reactive oxygen species and neutralizes them, thereby preventing them from causing damage to cells [\[R\]](#), [\[R\]](#), [\[R\]](#).

UGT Genetics

Certain genetic variations in [UGT1A1](#) reduce the enzymatic activity of UGT, which [impairs the body's ability to detox](#) and results in a buildup of toxic substances in the body. The normal version of *UGT1A1* (the one with normal detox activity) is called *UGT1A1*1*, or the “wild” type allele [\[R\]](#).

One of the most important and well-studied genetic variants is ***UGT1A1*28*** ([rs34983651](#)). This variant causes an “insertion” mutation, which means it adds an extra ‘TA’ into the gene where there should be none. According to some reports, ***UGT1A1*28* causes a 70% reduction in enzyme activity** [\[R\]](#).

Other variants include ***UGT1A1*6*** ([rs4148323](#)) and ***UGT1A1*27*** ([rs6742078](#)), which also lower enzyme activity, leading to a reduced ability to detox. All of these variations in *UGT1A1* can lead to toxicity disorders. The minor variants of *UGT1A1*27* and *UGT1A1*28* are usually inherited together [\[R\]](#).

Other, less well-researched *UGT1A1* variants with reduced enzyme activity include:

- ‘A’ at [rs10929302](#) (*UGT1A1*93*) [\[R\]](#), [\[R\]](#), [\[R\]](#), [\[R\]](#)
- ‘T’ at [rs887829](#) (*UGT1A1*80*) [\[R\]](#), [\[R\]](#), [\[R\]](#)
- ‘G’ at [rs4124874](#) (*UGT1A1*60*) [\[R\]](#), [\[R\]](#), [\[R\]](#)
- ‘T’ at [rs4148325](#) [\[R\]](#), [\[R\]](#)
- ‘T’ at [rs199539868](#) [\[R\]](#)
- ‘T’ at [rs114982090](#) [\[R\]](#)

A [UGT2A1](#) variant, ‘G’ at [rs10518065](#), has been associated with poorer [cognitive performance](#). The negative effects of this allele are likely due to decreased production of glutathione, leading to increased oxidative stress in the brain [\[R\]](#), [\[R\]](#), [\[R\]](#).

The low-activity [UGT1A6](#) variants ‘G’ at [rs2070959](#) and ‘C’ at [rs1105879](#) have been associated with higher bilirubin levels and increased risk of toxicity from aspirin, benzene, and vinyl chloride [\[R\]](#), [\[R\]](#), [\[R\]](#), [\[R\]](#).

Finally, two [UGT2B7](#) variants, ‘G’ at [rs7438135](#) and ‘T’ at [rs7439366](#), have been associated with increased enzyme activity and decreased effectiveness of opioids [\[R\]](#), [\[R\]](#), [\[R\]](#), [\[R\]](#), [\[R\]](#).

HIGHER ACTIVITY

Likely higher UGT activity based on 11 genetic variants we looked at

Your top variants that most likely impact your genetic predisposition:

GENE	SNP	GENOTYPE
UGT2A1	rs10518065	GA
UGT2B7	rs7439366	TC
USP40	rs4124874	GT
UGT1A6	rs887829	CC
UGT1A6	rs6742078	GG
UGT1A6	rs4148325	CC
UGT1A1	rs4148323	GG
UGT2B7	rs7438135	GG
UGT1A6	rs2070959	AA
UGT1A6	rs1105879	AA
UGT1A6	rs10929302	GG
UGT1A1	rs199539868	CC
UGT1A1	rs114982090	CC

The number of "risk" variants in this table doesn't necessarily reflect your overall result.
